Q.1 
$$1+2+3+\cdots+30=?$$

**Sol.** 
$$\frac{n(n+1)}{2} = \frac{30 \times 31}{2}$$
$$= 15 \times 31$$
$$= 45$$

$$\mathbf{Q.2} \quad \mathbf{1}^2 + \mathbf{2}^2 + \mathbf{3}^2 + \dots + \mathbf{12}^2 = ?$$

Sol. 
$$\frac{n(n+1)(2n+1)}{6} = \frac{12 \times 13 \times 25}{6}$$
$$= 50 \times 13$$
$$= 650$$

Q.3 
$$1^3 + 2^3 + 3^3 + \cdots + 9^3 = ?$$

Sol. 
$$\left[\frac{n(n+1)}{2}\right]^2 = \left(\frac{9 \times 10}{2}\right)^2$$
  
=  $45^2$   
=  $2025$ 

$$Q.4 1 + 3 + 5 + \cdots + 49 = ?$$

**Sol.** 
$$x^2$$

We know, 
$$x = \frac{n+1}{2}$$

$$=\frac{49+1}{2}$$

$$\therefore x^2 = (25)^2$$

$$= 625$$

Q.5 
$$2+4+6+\cdots+5+58=?$$

**Sol.** 
$$x(x + 1)$$

We Know, 
$$x = \frac{n}{2}$$

$$=\frac{58}{2}$$

$$= 29$$

$$x(x+1) = 29(29+1)$$

$$= 29 \times 30$$

@gmail.com

$$Q.6 51 + 53 + 55.... + 99 = ?$$

**Sol.** 
$$(1+3+5+\cdots 99)-(1+3+5\cdots +49)$$

For 
$$1 + 3 + 5 + \dots 99$$

by using formula: x<sup>2</sup>

Trick: 
$$x = \frac{n+1}{2}$$
  

$$= \frac{99+1}{2}$$

$$x = 50$$

$$x^2 = (50)^2$$

$$= 2500$$
For  $1+3+5\cdots+49$ 

For 
$$1 + 3 + 5 \dots + 49$$

Solving: 
$$(1+3+5+\cdots 99) - (1+3+5\cdots +49)$$

$$= 2500 - 625$$

$$= 1875$$

This method can be used when series starts from random number in between. That is series doesn't starts from 1, 2 etc.

Trick: x<sup>2</sup>

 $x = \frac{x+1}{2}$ 

= 25

 $x^2 = (25)^2$ 

= 625

 $=\frac{49+1}{2}$

# FINDING THE SUM "UPTO N TERMS"

**Formula**: 
$$S_n = \frac{n}{2} [2a + (n-1)d]$$

where  $a = 1^{st}$  Digit, d = difference,  $n = n^{th}$  term

### Q.8 Find the sum

$$1 + 3 + 5 + 7 + 9 \cdots$$
 upto 15 terms

Sol. 
$$S_n = \frac{n}{2}[2a + (n-1)d]$$
  
 $S_{15} = \frac{15}{2}[2(1) + (15-1)2]$   
 $= \frac{15}{2}[2 + 28]$   
 $= \frac{15}{2} \times 30$ 

= 225 {d = difference, so difference between any 2 digits as per question is 2}

In this, we don't know what exactly us 15th term, so we used formula of Arithmetic Progression

# FINDING A NUMBER

## Q.10 What is two third of half of 369?

**Sol.** 
$$\frac{2}{3} \times \frac{1}{2} \times 369 = ?$$
 = 123

## Q.11 If one-third of one-fourth of a number is 15, then three-tenth of the number is?

Sol. 
$$\frac{1}{3} \times \frac{1}{4} \times x = 15$$
$$x = 15 \times 4 \times 3$$
$$x = 180$$

Now, three-tenth of this number

$$= \frac{3}{10} \times$$

$$= \frac{3}{10} \times 180$$

$$= 54$$

# Q.12 If the sum of two numbers, one of which is $\frac{2}{5}$ times the other is so, then the numbers are?

**Sol.** Let's take first no. 
$$= x$$

Then according to question, second no. =  $\frac{2}{5}x$ 

$$x + \frac{2}{5}x = 50$$

$$\frac{5x + 2x}{5} = 50$$

$$7x = 250$$

$$x = \frac{250}{7}$$

$$\therefore$$
 first no. = x

$$=\frac{250}{7}$$

Second no. = 
$$\frac{2}{5}x$$

$$= \frac{2}{5} \times \frac{250}{7}$$
$$= \frac{100}{100}$$

Q.13 If  $\frac{1}{2}$  is added to a number & the sum is multiple by 3, the result is 21 then the number is?

**Sol.** Let the no. be x

$$\left(\frac{1}{2} + x\right) \times 3 = 21$$

$$\frac{3}{2} + 3x = 21$$

$$3x = 21 - \frac{3}{2}$$

$$3x = \frac{42 - 3}{2}$$

$$3x = \frac{39}{2} \Rightarrow \boxed{x = \frac{13}{2}}$$

**Question to Practice** 

Q.14 If  $4/5^{th}$  of a number exceeds its  $3/4^{th}$  by 8, then the number is

Q.15 If 3/4 of a number is 7 more then 1/6 of the number, then 5/2 of the number is?

# **PROBLEMS ON AGES**

Q.16 The present ages of A and B are in the ratio 4 : 5 and after 5 years they will be in the ratio 5 : 6. The present age A is?

**Sol.** Let age be 'x'

4x:5x

After 5 years  $\Rightarrow 4x + 5:5x + 5 = 5:6$ 

$$\frac{4x+5}{5x+5} = \frac{5}{6}$$
  $\left\{a: b = \frac{a}{b}\right\}$ 

By cross Multiplication 24x + 30 = 25x + 25

$$x = 5$$

∴ Present Age of 
$$A = 4x$$
  
=  $4 \times 5$   
= 20 years

Present Age of B = 5x

$$= 5 \times 5$$
  
= 25 years

Q.17 The ratio of present ages of two brothers is 1 : 2 and 5 years back, the ratio was 1 : 3 what will be the ratio of their ages after 5 years?

Sol. Past 
$$-5$$
 Present 1:3  $1:2$   $x:2x$ 

$$x - 5: 2x - 5 = 1:3$$

$$\frac{x-5}{2x-5} = \frac{1}{3}$$

$$3x - 15 = 2x - 5$$

$$x = 10$$

After 5 years, ratio of their ages

$$\Rightarrow$$
 x + 5: 2x + 5

$$10 + 5: 2(10) + 5$$

15:25

- Q.18 I am three times as old as my son. 15 years hence, 9 will be twice as old as my son. The sum of our ages is?
- **Sol.** Father Son

3x x

After 15 years

$$3x + 15$$
  $x + 15$ 

$$3x + 15 = 2(x + 15)$$

$$3x + 15 = 2x + 30$$

$$x = 15$$

Son age (x) = 15 years

Father age 
$$(3x) = 3 \times 15$$

$$= 45 \text{ years}$$

$$\therefore$$
 Sum of their ages = 45 + 15

$$= 60$$
 years

- Q.19 10 years ago daughter's age was two-fifth of her mother's age that time. while 10 years hence her age will be three-fifth of her mother's age then Find the difference in the ages of the two
- **Sol.** Let daughter's age = x

Let Mother's age = y

10 year <mark>ago</mark>

$$(x-10) = \frac{2}{5}(y-10) \rightarrow (1)$$

10 year hence

$$(x + 10) = \frac{3}{5}(y + 10) \rightarrow (2)$$

An solving equ. (1)

$$5x - 50 = 2y - 20$$

$$5x - 2y = 30 \rightarrow (3)$$

On solving equ. (2)

$$5x + 50 = 3y + 30$$

$$5x - 3y = 20 \rightarrow (4)$$

Solving equ. (3) & (4)

$$5\% - 2y = 30$$

$$-5\% + 3y = 20$$

$$y = 50$$

$$5x - 2y = 30$$

$$5x - 100 = 30$$

$$x = 26$$

Difference of ages = Mother age - daughter age = 50 - 26= 24

$$P_2 = ?$$
,  $w_2 = 5400$ ,  $H_2 = 4$ ,  $D_2 = 3$ 

$$\frac{P_1 H_1 D_1}{P_2 H_2 D_2} = \frac{w_1}{w_2}$$

$$\frac{15 \times 2 \times 6}{x \times 4 \times 3} = \frac{3240}{5400}$$

$$\frac{15}{x} = \frac{81}{135}$$

- Q.24 Ajay & Sunil together can complete a piece of work in 10 days, Sunil & Sanjay in 15 days & Sanjay and Ajay. They worked together for 6 days, and then Ajay leaves. Sunil and Ajay worked for 4 more days, and Sunil leaves How long will Sanjay take to complete the work?
- **Sol.** Work done in 1 day:

Ajay + sunil = 
$$\frac{1}{10}$$

Sunil + Sanjay = 
$$\frac{1}{15}$$

Sanjay + Ajay = 
$$\frac{1}{20}$$

$$2 \text{ Sunil} + 2 \text{ Ajay} + 2 \text{ Sanjay} = \frac{1}{10} + \frac{1}{15} + \frac{1}{20}$$

Sunil + Ajay + Sanjay = 
$$\frac{1}{2} \left[ \frac{13}{60} \right]$$

Sunil + Ajay + Sanjay = 
$$\frac{13}{120}$$
 ... (1)

Work done in 6 days = 
$$\frac{13}{20} \times 6$$

$$=\frac{13}{20}$$

Work done in 4 days = 
$$\frac{1}{15} \times 4$$

By Sunil & Ajay = 
$$\frac{4}{15}$$

: Sunil left after 4 days, Ajay left after 6 days

Remaining work = 
$$1 - \begin{bmatrix} Work done \\ in 6 days \end{bmatrix} + \begin{bmatrix} Work done \\ in 4 days \end{bmatrix}$$

$$=1-\left[\frac{13}{20}+\frac{4}{15}\right]$$

$$=1-\frac{55}{60}$$

Remaining work =  $\frac{1}{2}$  [to be completed by Sanjay alone]

No. of days required, from equ. (1)

Sanjay + 
$$\underbrace{\text{Ajay + Sunil}}_{}$$
 =  $\frac{13}{120}$ 

$$Sanjay + \boxed{\frac{1}{10}} = \frac{13}{20}$$

(given in question)

That Ajay & Sunil take 10 days

Sanjay = 
$$\frac{13}{120} - \frac{1}{10}$$

Sanjay 
$$=\frac{1}{120}$$

⇒ Sanjay can complete yob in 120 days.

We know, Remaining work =  $\frac{1}{12}$ 

∴ Days req. to complete 
$$\frac{1}{12}$$
 work by Sanjay =  $120 \times \frac{1}{12}$ 

Sanjay will take 10 days to complete work

# **TIME AND DISTANCE**

- Q.27 Two friends started for a place one by motorcycle and other by car. The speed of motorcycle is 30 km/hr. and that of car is 24 km/hr. The first one takes 6hr.12 min to reach the destination. Find the time of reaching of second one.
  - (A) 8:00 hr.
- (B) 7.25 hr.
- (C) 7.50 hr.
- (D) 7.75 hr

**Sol.** Motorcycle: 30 km/hr.

6 hr./2min.

- $\Rightarrow$  1 hr. = 30 km
- $\therefore$  Distance for 6 hrs. =  $6 \times 30$  km

$$= 180 \text{ km}$$

1 hr. = 60 min

60 mins = 30 km

$$1 \min = \frac{3\emptyset}{6\emptyset} = \frac{1}{2} \text{ km}$$

$$\therefore \text{ Distance for } 12 \text{ min} = \frac{1}{2} \times 12$$

$$= 6 \text{ km}$$

Distance covered in 6 hrs. 12 min = 180 + 6

$$= 186 \text{ km}$$

Speed = 24 km/hr.

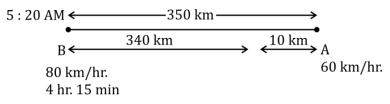

Time = DIstance/Speed

$$=\frac{186}{24}$$

$$\Rightarrow$$
 Time = 7.75 hr.

- Q.28 Kamal left for the City A from City B at 5:20 AM He travelled at a speed of 80Km/ hr. for 4 hrs. 1 min. After that, the speed was reduced to 60 km/hr. If the distance between two cities is 350 km, at what time did hamal reach City A
  - (A) 9: 20 AM
- (B) 9: 25 AM
- (C) 9:35 AM
- (D) 9:45 AM

Sol.

$$1 \text{ hr.} = 80 \text{ km}$$

Distance = Speed  $\times$  Time

$$= 80 \times 4 \text{ hr.}$$

$$= 320 \text{ km}$$

1 hr. = 80 km

60 min = 80 km

$$1 \min = \frac{8\emptyset}{6\emptyset}$$

$$15 \text{ mins} = \frac{8^4}{g_{2_1}} \times 15^5$$

$$= 20 \text{ km}$$

So Total distance travelled in 4 hr. 15 min = 320 + 20

$$= 340 \text{ km}$$

Given, Total distance between A to B = 350 km

& distance travelled by B = 340 km From 4 hrs. 15 min

So remining distance = 350 - 340

$$= 10 \text{ km}$$

Given speed = 60 km/hr.

$$\Rightarrow$$
 1 hr. = 60 km

$$\Rightarrow$$
 60 min = 60 km

$$\Rightarrow 1 \min = 1 \text{ km}$$

$$\therefore 10 \text{ km} = 10 \text{ min}$$

So 10 mins more to reach city A to travel 350 km

So total time = 4 hrs. 15 mins

Journey started at 5: 20 AM

$$+ 4:25$$

$$\frac{D}{30 \text{ km/hr.}} - \frac{D}{24 \text{ km/hr.}} = 11 \text{ min}$$

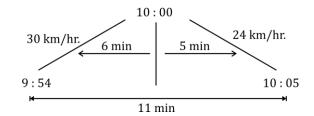

$$\frac{D}{30 \text{ km/kr.}} - \frac{D}{24 \text{ km/kr.}} = \frac{11}{60} \text{kr.}$$

$$\frac{4D - 5D}{12\emptyset} = \frac{11}{6\emptyset}$$

$$D = \frac{11 \times 12}{6} \text{km}$$

$$D = 22 \text{ km}$$

H = Hour

M = Minutes

By using formula, If the angle between hour hand & minute hand is greater than 180°, then use:

360° – angle obtained by formula method

# What is the angle between minute hand and hour hand at 1: 20?

**Using Formula:** Sol.

$$\theta = \left| 304 - \frac{11}{2} (M) \right|$$

$$\theta = \left| 30(1) - \frac{11}{2}(20) \right|$$

$$\theta = |-80|$$

$$\theta = 80^{\circ}$$

# Find at what time between 1:00 and 2:00, the hands of clock will be together

**Sol.** 
$$\theta = 30H - \frac{11}{2}M$$

$$0 = 30 \times 1 - \frac{11}{2} M$$

$$-30 = -\frac{11}{2}M$$

$$30 = \frac{11}{2}M$$

$$M = \frac{30 \times 2}{11}$$

$$=\frac{60}{11}$$

$$=5\frac{5}{11}$$

$$\Rightarrow 1:05:\frac{5}{11}\sec$$

$$\begin{cases} \theta = 0^{\circ} \\ \text{as hands of clock} \\ \text{will be together} \end{cases}$$

### 0.39 Find at what time between 3:00 & 4:00, the hands of clock will be at a right angle

**Sol**. 
$$\theta = 30H - \frac{11}{2}M$$

If 
$$\theta = +90^{\circ}$$

$$90 = 30 \times 3 - \frac{11}{2} (M)$$
  $\{\theta = \pm 90^{\circ}\}$ 

$$\{\theta = \pm 90^{\circ}\}$$

$$90 - 90 = -\frac{11}{2}M$$

$$0 = -\frac{11}{2}M \Rightarrow M = 0$$

If 
$$\theta = -90^{\circ}$$

$$-90 = 30 \times 3 - \frac{11}{2}M$$

$$-90 - 90 = -\frac{11}{2}M$$

$$\neq 180 = \neq \frac{11}{2}M$$

$$M = \frac{180 \times 2}{11}$$

$$=\frac{360}{11}$$

$$=32\frac{8}{11}\sec$$

# At what time between 4:00 & 5:00, the hands of Clock will be in opposite direction?

**Sol**. 
$$\theta = 30 \text{ H} - \frac{11}{2} \text{M}$$

$$\theta = \pm 180^{\circ}$$
 (Because opposite direction)

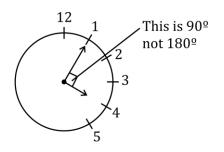

If 
$$\theta = +180^{\circ}$$

$$180 = 30 \times 4 - \frac{11}{2}M$$

$$180 = 120 - \frac{11}{2}M$$

$$60 = -\frac{11}{2}M$$

$$M = \frac{60 \times 2}{11}$$

$$\begin{cases} \text{therefore we} \\ \text{cannot consider} \\ \theta = +180^{\underline{o}} \end{cases}$$

$$M = \frac{120}{11}$$

If we observe 4:  $10: \frac{10}{11}$  sec.

$$=10\frac{10}{11}$$

$$\Rightarrow$$
 4:10: $\frac{10}{11}$  sec.

— not Possible as it won't form 180º

If 
$$\theta = -180^{\circ}$$

$$-180 = 30 \times 4 - \frac{11}{2} \times M$$

$$-180 - 120 = -\frac{11}{2}M$$

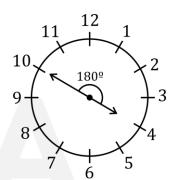

$$-300 = -\frac{11}{2}M$$

$$M = \frac{300 \times 2}{11}$$

$$=\frac{600}{11}$$

$$=54\frac{6}{11}$$

At 4: 54:  $\frac{6}{11}$  sec. the hands of clock will be in opposite direction.

# **AVERAGE**

Sum of Observation Average = Total Number of Observation Formula:

- Q.65 The average age of A, B and C is 26 years If the average age of A and C is 29 years. What is the age of B in years?
- Sol. given:

given: 
$$\frac{A+B+C}{3}=26, \qquad \frac{A+C}{2}=29$$

$$A+B+C=26\times 3 \qquad A+C=29\times 2$$

$$A+B+C=78 \qquad A+C=54$$
Age of B = Total  $-(A+C)$ 
=  $78-54$ 
=  $20$  years.

The average of 7 numbers is 5. If the average of first six of these numbers is 4, the seventh number is?

Sol. 
$$\begin{cases} Average = \frac{Total \text{ of } 7' \text{ no.}}{No. \text{ of terms}} \\ 5 = \frac{Total \text{ of } 17' \text{ no.}}{7} \end{cases}$$

Total of '7' no.

$$= 7 \times 5$$

$$= 35$$

$$\begin{cases} \text{Average} &= \frac{\text{Total of 6 no.}}{\text{No. of Terms}} \\ 4 &= \frac{\text{Total of 6 no.}}{6} \end{cases}$$

Total of 6 no. =  $6 \times 4$ 

$$= 24$$

$$\therefore \text{ Seventh no.} = 35 - 24$$
$$= 11$$

The average of marks obtained by 120 candidates was 35. If the average of marks of passed Q.67Candidates was 39 & that of failed candidates was 15, the number of candidates who passed the examination is?

**Sol.** Avg = 
$$\frac{\text{Total marks obtained}}{\text{No of Students}}$$

$$35 = \frac{Total\ marks}{120}$$

Total marks = 
$$120 \times 35$$
  
=  $4200$ 

Let's assume no of Passed candidates as 'x'

4200 = Marks obtained by passed candidate + Marks obtained by failed Candidate

$$4200 = (x \times 39) + [(120 - x) \times 15]$$

$$4200 = 39x + 1800 - 15x$$

$$2400 = 24x$$

$$x = 100$$

 $\therefore$  Passed candidates = 100

- Q.80 What is the smallest number with which 5400 may be multiplied so that product is perfect cube?
- Q.81 Square of difference between two numbers is 9 while the sum of squares of those two number is 225 what is their product?
- **Sol.** Given:  $(a b)^2 = 9 \dots (1)$

$$a^2 + b^2 = 225 \dots (2)$$

We know identity,

$$(a - b)^2 = a^2 + b^2 - 2ab$$

From (1) & (2)

$$9 = 225 - 2ab$$

$$ab = 116$$

$$ab = 58$$

$$∴$$
 Produce = 58
